

Max Matthiessen

Max Matthiessen has control over their special applications with monitoring from op5!

After recommendations, Max Matthiessen, a independent consultant for personal insurances and long term savings, chose op5 for his monitoring.

- We didn't have anything but manual monitoring previously, says Per Carlbom, IT-services Manager at Max Matthiessen. It is, in the long run, both costly and demanding of resources. When we were going to invest in a monitoring system, we believed that we were getting our money's worth when selecting a system, which is developed based on Open Source.

- We have also received assistance from op5's developers with the adjustments to our special applications. op5's product supports Max Matthiessen's own application, so that we are truly able to trust reply times and important functionality with our operation as fund consultants. We have, for instance, a fund trading platform which should be up and running throughout the entire day, and year, and therefore requires one to have total control and availability, concludes Per.

op5's products are developed based on a number of projects from the Open Source World. By adding user-friendliness, functionality and an overall support liability for daily network service queries as well as new releases, one supplies a complete system, which in its entirety, very well competes with the classical "closed" systems. The client receives access to source codes and the ability to add or modify functions for his/her own operation without special tools or the need for expertise knowledge.
